Abstract

- Factors affecting air quality in a specific area include energy consumption, energy mix, control status, and local emission effects.
- With North Korea's energy consumption amounting to less than 10% of that in South Korea, there will be discussion on whether emissions of air pollutants in North Korea also correspond to less than 10% of those in South Korea.
- There will be discussion regarding the points to consider when anticipating changes in air quality related to the achievement of carbon neutrality
